Nissan Maximizes Form Conversion with Decibel's Experience Analytics

Enabling Experimentation Resulting in ~30% Increases in Conversions

Ranking in the top 10 largest car companies in the world, at Nissan, you can experience thrilling new vehicles, from the rise of the electric crossover to a future vision of the sports car that has exhilarated drivers for over 50 years.

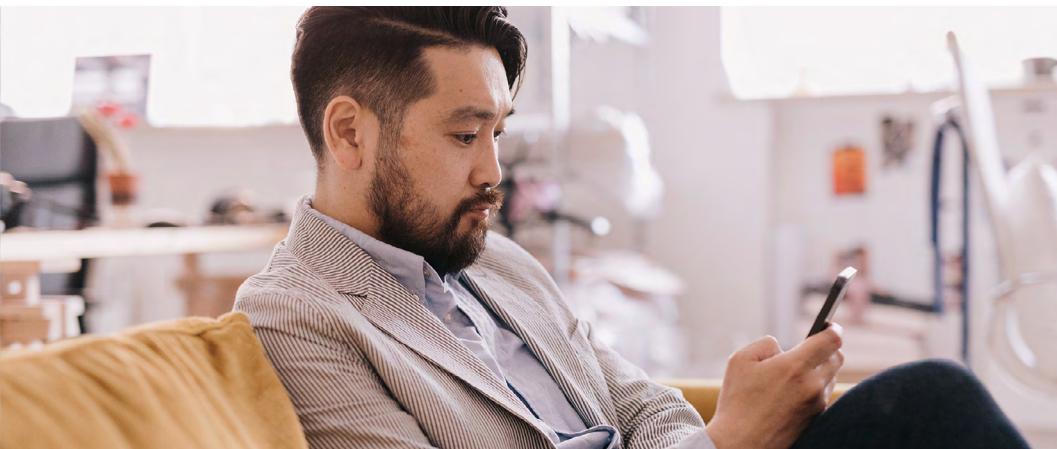

How Nissan Approaches Digital Experience

Nissan creates geo-specific websites to market to their customers.

Nissan has been working with Decibel, the leader in Digital Experience Analytics, for several years to ensure they deliver the very best online experience for their customers.

Decibel is utilized at all stages of this process, from the initial discovery of an experience issue to testing website variants and finally validating the success of those changes.

With an array of forensic tools such as session replays, heatmaps, and journey analytics, digital teams have everything they need to achieve a 360° view of customer experience. The team at Nissan used the Digital Experience Score (DXS) and other analytics tools in Decibel to uncover multiple areas that were underperforming.

What is DXS®

The Decibel solution is driven by the Digital Experience Score, or DXS, the first universal metric that measures the digital customer experience at scale.

Founded in data science and powered by machine learning, DXS measures every user session –crunching billions of datapoints to quantify user behavior in real time, delivering an objective score (from 0-10) of every customer experience across websites and apps. DXS is based on 5 pillars of digital experience: Engagement, Frustration, Form, Technical and Navigation.

With DXS, optimization teams can quickly see where they need to invest efforts to enable the best opportunities for improving experiences and revenue.

Optimizing form experience to increase leads

One of the most important lead generation areas on the website are the pre-sales forms. There are many reasons a customer might complete the pre-sales form. These include booking a test drive, requesting a brochure or requesting a quote for a particular vehicle from a dealership.

The team noticed that the Form Experience Score was below average and there was no obvious cause for this. They decided to further investigate by looking at Decibel's form analytics tool. Within the form analytics tool they discovered a high abandonment rate and a high rate of errors associated with the "Preferred method of contact" field. In this field, a drop-down menu contained three options for contact: Email, SMS or Phone call.

Nissan chose to change the selection type from drop-down menu to a radio button selection and A/B tested the options. They also rearranged the answers to ensure that the most popular selection, email, was now positioned at the top of the list.

The selection rate increased on the radio buttons compared to the previous drop-down menu, with visitors less likely to abandon the form and less likely to run into errors.

The form completion rate increased by 32.5%. This represented a significant uplift for Nissan.

"Changing to radio buttons represented a quick win for us – and Decibel made it easy."

increase in
completion rate

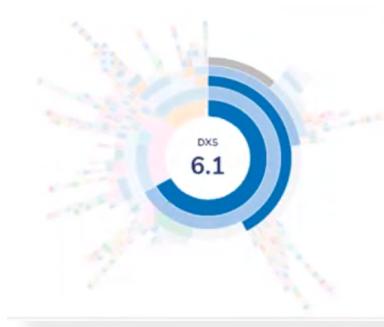

"We use Decibel's DXS as one of our performance indicators to measure and benchmark experience quality across our key regions. It helps us better understand a user's digital body language - their motivations and the quality of their actions, which allows us to create more meaningful and authentic experiences."

Uncovering navigation issues with journey analysis

A key Nissan market had an underperforming ‘Book a Test Drive’ form. After creating a segment of customers who engaged with the form, they discovered these individuals had a lower engagement score and an increased level of frustration. This made it an area of focus for the team.

Using Decibel’s Journey analysis tool, looping behavior was found between the dealer selection page and the form. It was clear that the navigation was proving confusing for customers and contributing to drop-off.

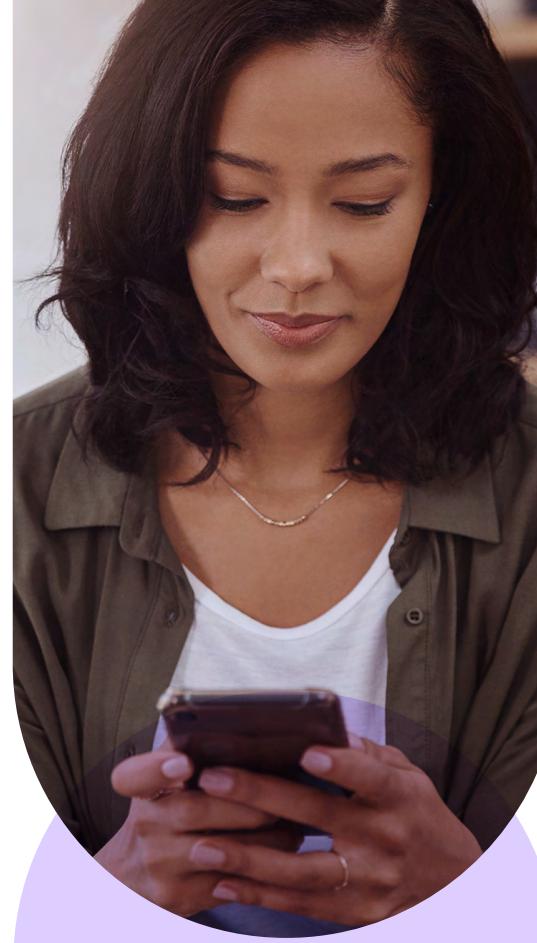

The confirmation of dealer selection was shown on the test drive form itself, rather than requiring customers to navigate between pages. On this same page, a confirmation of the vehicle selection was displayed.

Following A/B testing of the form structure, the form completion rate had significantly improved. For customers on mobile, the rate increased by 6.3% and desktop users had an increase of 9.9%.

“Decibel’s analysis played a key role in designing this test and getting such a great outcome.”

Senior Data Analyst, Nissan

The ‘Book a Test Drive’ form is a key lead generation tool for the site, so Nissan was very encouraged by the strong results.

Simplifying the visitor journey for greater impact

An issue affecting digital customer experience was identified on the Vehicle Compare tool. On this tool, a CTA took users to the Configurator, where customers can select versions of a particular vehicle. Using Decibel's Experience Data, the team discovered that customers who moved between stages of the journey using this CTA had an elevated frustration score and a lower DXS overall.

The team took a close look at the journey and found that customers moving to the Configurator from the Vehicle Compare tool were having to enter their choices for the grade and engine of the vehicle multiple times. They hypothesized that directing customers to the Colors tray rather than the Grades tray would eliminate this duplication.

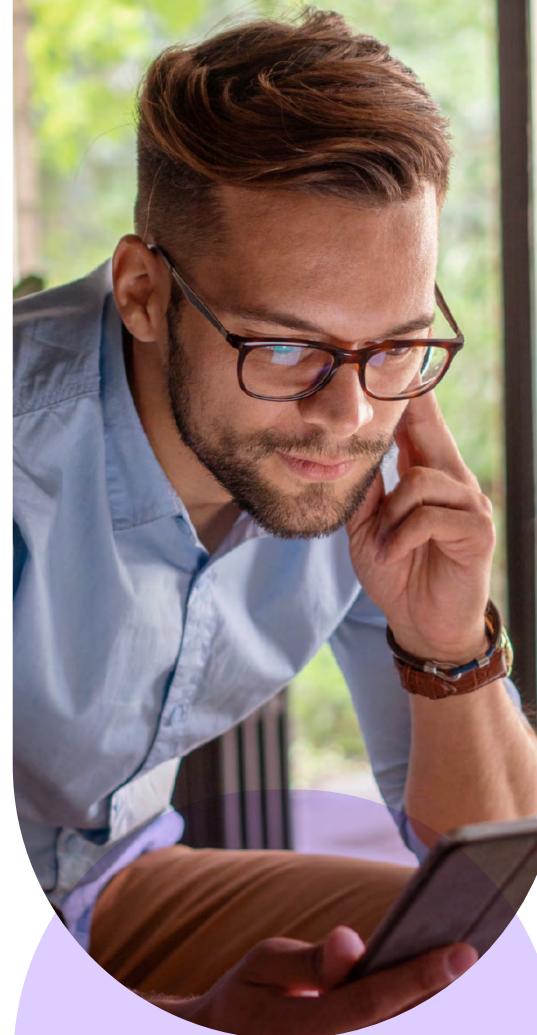

They created an A/B test with a control and a new design where clicking the "Configure Your Vehicle" button had users land on the Colors tray of the Configurator. The team had several goals for this change:

- Increase Configurator Completion Rate
- Improve the DXS score of the journey
- Improve the Frustration Score

The Nissan team saw positive changes across all goals.

Most encouragingly, by linking directly to the Colors tray, the Configurator Completion Rate saw an incredible 86% improvement. The team took two important learnings from this successful test:

- Journeys between tools should not require customers to make decisions more than once as it can contribute to drop-off
- Low traffic to the Compare Tool could be improved with better signposting and further optimized user journeys

86%
improvement in
Configurator
Completion Rate

The team went on to apply these learnings to the website. The new design generated a 16% increase in Configuration Completion Rate.

"This particular project was all about improving the digital experience. We saw the increased frustration through Decibel and wanted to really bring that down for our customers. It was great to see the impact of a better experience on our KPIs."

in Configuration Completion Rate

New Vehicle Launch – the Nissan Ariya

A further optimization project centered on the Visualizer tool for an upcoming new vehicle launch – the Nissan Ariya. This launch represented a great opportunity to use insights from Decibel to maximize interest in the new vehicle and boost lead generation.

The Ariya Visualizer allows website visitors to experience a virtual tour of the vehicle.

66

"With the Covid-19 pandemic preventing a lot of dealership visits, we had to find a way to show off the new vehicle that was almost as engaging as seeing it in real life. The virtual tour was our answer for that – but we wanted to make sure it was having the right impact. That's where Decibel helped."

Senior Data Analyst, Nissan

"Decibel's Professional Services team was a real

driver for our successful, on-time rollout to over 25 global markets; they made it so painless. Their support team are also a true asset and extension to our optimization

team, contributing to our continuous success in improving Customer Experience and growth for Nissan."

Looking at behavioral data from both Decibel and Adobe Analytics, it was clear that visitors who interacted with the Visualizer were more qualified leads and were more likely to submit a form indicating their interest. Decibel showed that these visitors also had a high DXS. From this, the team could hypothesize that focusing their efforts on increasing entries to the Virtual Car Visualizer would result in improved KPIs. At the beginning of their analysis, just 0.8% of users interacting with the Visualizer made it the Virtual Car and 68% were exiting the site entirely.

In order to proceed to the Virtual Car page, users had to exit the initial Visualizer tool (which showed the outside of the vehicle and color options) and then click through on a CTA further down the page. To begin testing, the team produced variants of the initial visualizer tool that had CTAs directly on the page—eliminating the need for additional journey steps. Two versions of the CTA were trialled, one which read the “Take a Virtual Test Drive” and another, “Explore Inside....”

“Decibel is an essential tool in our optimization armory, allowing our markets to make better decisions based on evidence instead of guesswork. Its vast feature set caters for all levels of maturity and positions within Nissan. It gives us another dimension of looking at the data that we can't get anywhere else.”

39%

increase in pre-sale leads

The “Explore Inside” version increased pre-sale leads by 39%.

Results

Decibel helps organizations make every digital experience effortless. We're the only analytics software in the world that can identify, score, and prioritize every online user experience impacting conversion, sales, and loyalty across your website and apps. Our forensic tools then get to the root cause so you can troubleshoot, validate hypotheses, and find the fastest

path to resolution. The world's leading brands—including Fidelity, Lego, and British Airways—harness Decibel for better conversions, more sales, and increased customer loyalty across their digital offerings. Optimizing digital experiences has never been this easy.
