5 Ways Experience Signals are Shaping the Future of CX

Medallia
Surveys capture the past. Signals power the present.

Understanding customer needs and expectations has always been at the heart of customer experience. But for many companies, early forms of gathering customer feedback simply relied on data collected from surveys.

While this used to be enough, these surveys don’t provide critical feedback across the customer lifecycle. Omnichannel engagement combined with omni-channel signal collection is the only way to establish and truly understand the connection between customer behaviors, thoughts, intentions, and needs.

The data richness of experience signals allows brands to identify the root causes of ongoing customer issues, opportunities for improvement, and even proactively see what customers are telling them. Even people who don’t engage when asked create vital signals which are captured in your operational systems.

Getting CX right starts with a clear understanding of what matters most to the customer. Done right, CX delivers tangible business impact—driving loyalty, reducing churn, and upselling new products and services.
What are experience signals?

Signals are customer experience data points that come from different systems, channels, in-house technology, and even third-party sources.

Signal types include digital clickstream data, e-commerce information, POS data, call center interactions, CRM data, service interactions, IoT data, HR data, sentiment captured from videos, sales and marketing tools, and yes, even survey data.

Data Types
Structured data is made up of objective responses from a set of pre-determined inputs (i.e. surveys). Unstructured data is open-ended with feedback coming in many forms—such as call transcripts, messaging logs, website contact forms, social reviews, and more.

Indirect Feedback
What customers and employees are saying about you— in channels that aren’t expressly designed to measure feedback.

Direct Feedback
How customers and employees share their opinion about you when directly solicited.

Operational Data
Data from various, specialized systems of record across an organization, consisting of transactional and operational interactions.

Observed Behavior
Data and events that reflect customer and employee actions or behaviors that are either observed or inferred.

More signals means better customer views.

With customer expectations evolving and the demand for greater speed and agility, CX leaders are now looking to a broader, more diverse set of experience signals to truly understand how they’re doing in the eyes of the customer. To see the whole picture and act swiftly, with confidence, it’s critical now more than ever, for brands to have a complete and comprehensive view of customer needs.

Why aren’t more companies using signals? For many organizations, timely and relevant experience signals are not leveraged because they exist in multiple, disparate systems, aren’t structured into usable datasets, and are not connected to known identities. In fact, many signals are expressed in ways that are invisible to organizations because they occur in operational and third-party systems that are not connected with the CX data environment.
Put all customer data to work.

Combine experience, operational, and behavioral data across your systems of record and engagement to get the best insights. Customers are providing crucial signals each and every day in how they act and engage with your brand (or how they don’t).

For example, data from records captured in a CRM platform can be combined with other operational and observed behavior to not only uncover new patterns but also predict risk of churn.

By using a diverse signal field, you’ll have a more complete understanding of behaviors which leads to new insights and a deeper understanding of customer expectations.

Uncover customer needs in real-time.

Using signals to better understand customer needs helps you expedite issue resolution. For example, incorporating signals like chat and messaging allows you to resolve issues as they happen. In addition to immediate resolution, incorporating robust customer data and AI-powered analysis provides richer insights and learnings over time to improve CX programs.

Companies that integrate feedback from four or more channels have Net Promoter Scores® (NPS) that are 14 points higher than those that only use one channel.

70% of consumers report that they expect an immediate response when they submit a complaint.

Companies that use social media, online reviews, and other unsolicited feedback are 15% points likely to improve customer experience.
03 Engage customers whenever, wherever.

By engaging customers on their terms, you can increase willingness to provide direct feedback by offering the broadest set of options to do so. Observing customer behaviors can help identify channel preferences. By looking at more signals, you’ll create more ways to listen and understand feedback.

04 Understand everyone—not just responders.

Receive insights from all customers about how they feel about your brand, product, or services by gathering indirect customer feedback. Traditional CX programs primarily look at survey data and compile feedback based only on those who take the time to respond to the survey. While that feedback is important and valuable, it completely misses those (most likely the majority) who do not respond to the survey.
05 Discover new ideas faster.

There’s a good chance your next big idea or product innovation will come from an employee. Find ideas faster by crowdsourcing them from both employees and customers. Using those employee ideas as additional signals brings a richer view of what your customers expect out of the experiences your organization is providing—and any shortcomings you may not even be aware of.

4.6x Employees who feel their voice is heard are 4.6 times more likely to feel empowered to perform their best at work

Identifying and capturing signals.

To ensure that the broadest selection of experience signals are identified and mapped into your CX solution, review the ecosystem to find ways to engage:

- Look at customer journeys and life cycles to uncover all engagement points.
- Map out your current customer signals, including social media.
- Determine signal opportunities sourced from products and digital systems data, IoT and API data from 3rd party systems, and external customer data.

An important concept to understand while collecting customer signals is that every functional team will use different data in various formats. This means that your platform should be capable of analyzing and presenting data in ways optimized for each CX stakeholder. AI and machine learning play an important role in analyzing large data sets and providing intelligent recommendations for action.

Once signal collection, analysis, and action recommendations become automated, an organization can focus on optimizing each unique customer experience. This is the key to getting ahead of the customer and creating surprise-and-delight experiences.
Choosing the right platform.

The most effective CX requires the right mix of technology, processes, and people. Adopting a world-class, scalable platform to collect every signal is a good place to start. More than one thousand of the world’s leading brands rely on Medallia to:

- Collect a wide range of signals from thousands of first- and third-party sources
- Analyze millions of customer journeys
- Make insights actionable using industry-leading AI and automation
- Deliver customer-centric experiences with speed and scale

Start turning signals into positive customer experiences:
